Data Flow Diagram

Date	23 October 2026
Team ID	0827CY231029
Project Name	WanderWise – AI Travel Itinerary Planner
Maximum Marks	2 Marks

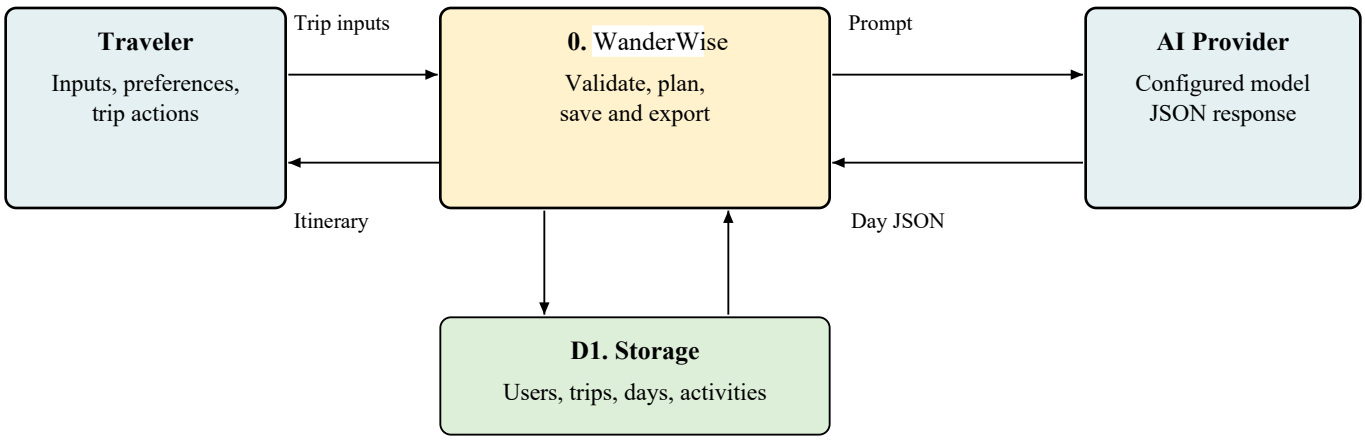

Data Flow Diagram

Show the movement of traveler data between external entities, application processes and persisted records.

DFD Symbol Legend

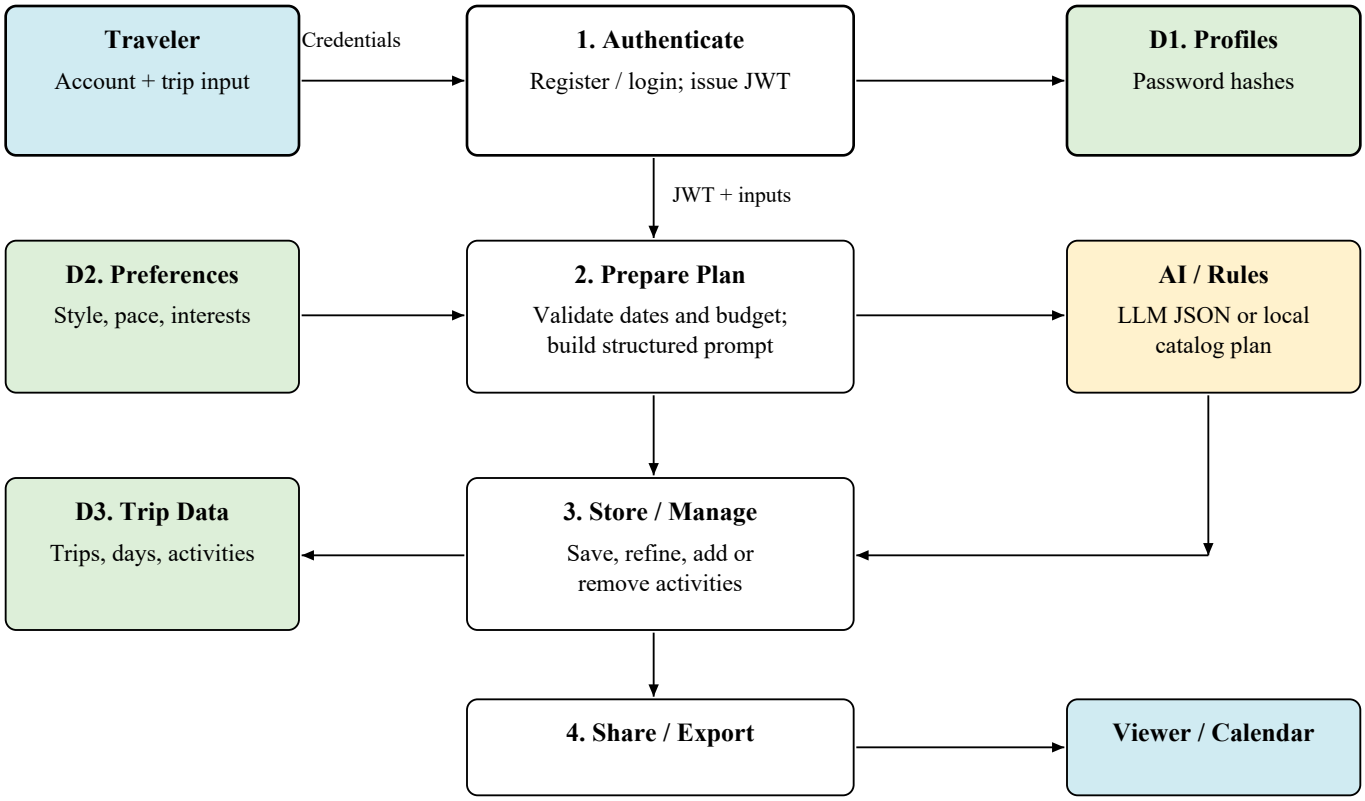

Symbol	Name	Description
Rounded box	External entity	Traveler, configured AI service or public share viewer.
Numbered box	Process	Validate inputs, generate a plan, save changes or export data.
Storage box	Data store	Profiles, preferences, trips, itinerary days, activities and logs.
Labeled arrow	Data flow	Credentials, preference inputs, prompts, day JSON and exported plans.

Level 0: System Context

Data Flow Diagram (continued)

Level 1: Planning and Sharing Flow

Flow Description

- Registration/login validates credentials and returns a JWT. Private routes use the JWT to scope stored records.

- Trip inputs and saved preferences form a structured prompt. A configured provider returns day JSON; local rules supply a plan on failure.

- The repository persists trips, days and activities. Saved plans can be edited or regenerated.

- Public sharing exposes one token-linked plan. Authenticated export returns JSON, Markdown or ICS.
